Answer: See answers above. In an electric circuit, the electric potential for a moving charge is gained in the battery and lost in a light bulb (or some resistor found in the external circuit). So the electric potential of a charge is the same for any two points which are not separated by a battery or by a light

Answer: A circuit which is complete in all respect, i.e., its all connections are intact is called a closed circuit.

When the switch is on, the current flows in it and the bulb glows (Fig. 12.22a). On the other hand, a circuit is called open or not complete (Fig. 12.22b), when connections are not intact, i.e., broken.

Lesson 6-4 Review. 1.

[0.56 A] You should recall that in a series circuit, there is only one value for current, as shown in the formula $I_s = I_1 = I_2 = \dots I_x$. If we find the total current, that will be equal to the current through the 5.0 Ω resistor. First, we will
