The heat equation, for example, is a stable partial differential equation because small perturbations of initial data lead to small variations in temperature at a later time as a result of the maximum principle. In partial differential equations one may measure the distances between functions using Lp norms or th

Dynamical systems theory is an area of mathematics used to describe the behavior of the complex dynamical systems, usually by employing differential equations or difference equations.When differential equations are employed, the theory is called continuous dynamical systems.From a physical point of view, continuous dynamical systems is a generalization of classical mechanics, a generalization ...

DSTA 2021 - Dynamical Systems Theory

The stability of a general dynamical system with no input can be described with Lyapunov stability criteria. A linear system is called bounded-input bounded-output (BIBO) stable if its output will stay bounded for any bounded input.

The qualitative theory of differential equations was the brainchild of the French mathematician Henri Poincaré at the end of the 19th century. A major stimulus to the development of dynamical systems theory was a prize offered in 1885 by King Oscar II of Sweden and Norway for a solution to the problem of determining the stability of the solar system. The problem was stated essentially as follows: Will the planets of the solar system continue forever in much the same arrangement as they do ...

Our aim is to introduce, explain, and discuss the fundamental problems, ideas, concepts, results, and methods of the theory of dynamical systems and to show how they can be used in speci?c examples. We do not intend to give a comprehensive overview of the present state of research in the theory of dynamical systems, nor a detailed historical account of its development.

Content: Dynamical Systems is one of the most active areas of modern mathematics. This course will be a broad introduction to the subject and will attempt to give some of the flavour of this important area. The course will have two main themes. Firstly, to understand the behaviour of particular classes of transformations.
