Symbiotic Interactions - A. E. Douglas - Oxford University Press. Symbiotic interactions are those relationships between organisms that permit some species to overcome their physiological limitations by exploiting the capacities of others. This volume presents a modern synthesis of scientific knowledge of symbiosis, from the molecular mechanisms underlying its function to the ecological and evolutionary impact of such associations.

The best studied symbiotic interactions are those between plants and arbuscular mycorrhizal fungi (AMF), and between legumes and nitrogen-fixing rhizobial bacteria (Oldroyd et al., 2011; Gutjahr and Parniske, 2013; Oldroyd, 2013). To form interactions with AMF, strigolactones are released by the plant to attract the fungus which in turn produces mycorrhizal factors and signals that activate the symbiosis signaling pathway in the root, leading to calcium oscillations.
